Question:

The altitude of a right triangle is 7cm less than its base. If the hypotenuse is 13cm, find the other two sides

Solution:

We get the equation

$$x^2 + (x - 7)^2 = 13^2 \quad (0.1)$$

$$x^2 - 7x - 60 = 0 \quad (0.2)$$

We can solve the above equation using fixed point iterations. First we separate x , from the above equation and make an update equation of the below sort.

$$x = g(x) = \frac{x^2 - 60}{7} \quad (0.3)$$

Applying the above update equation on our equation, we get

$$x_{n+1} = \frac{x_n^2 - 60}{7} \quad (0.4)$$

Now we start with an initial guess $x_0 = 10$

But we realize that the updated values always approach infinity for any initial value.

Thus we will alternatively use Newton's Method for solving equations.

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} \quad (0.5)$$

Where we define $f(x)$ as,

$$f(x) = x^2 - 7x - 60 \quad (0.6)$$

$$f'(x) = 2x - 7 \quad (0.7)$$

Thus, the new update equation is,

$$x_{n+1} = x_n - \frac{x_n^2 - 7x_n - 60}{2x_n - 7} \quad (0.8)$$

Taking the initial guess as $x_0 = 10$, we can see that x_n converges with x as,

$$x \approx 12.002 \quad (0.9)$$

$$x = 12cm \quad (0.10)$$

Alternatively, we can use the Secant method for solving equations.

$$x_{n+1} = x_n + f(x_n) \frac{x_n - x_{n-1}}{f(x_n) - f(x_{n-1})} \quad (0.11)$$

The altitude is

$$12 - 7 = 5\text{cm} \quad (0.12)$$

The base is 12cm and the altitude is 5cm
